

Preliminaries

- \mathcal{O}_K : The ring of integers.
- ect.

Circle Correspondence

We define S_K as the Schmidt Arrangement of \mathcal{O}_K , where $K = \sqrt{\Delta}$. Assume that Δ is a negative integer and that 0 divides itself.

We have a triple $(r, x, y) \in \mathbb{Z}^3$, which must adhere to

$$r \mid x^2 + y + y^2. \quad (1)$$

The triple results in a circle with curvature $2ir$, and a curvature-center $2(x + iy) + i$. We can represent the circle in S_K by the matrix

$$\begin{pmatrix} a + a'i & c + c'i \\ b + b'i & d + d'i \end{pmatrix} \quad (2)$$

which results in the the triple

$$(m, n, l) = \begin{cases} (bd' - b'd, bc' - a'd, a'd' - b'c'), & \text{if } \Delta = -1 \\ (b'd - bd', a'd - bc', bc - ad), & \text{otherwise} \end{cases}$$

Case 1. $r = 0$. To find the corresponding circle in S_K we let $a' = -\gcd(x, y)$. Then

$$a = \frac{-a'(1 + \|i\|y)}{x}, \quad c = c' = 0, \quad b = d = \frac{-x}{a}, \quad b' = d' = \frac{y}{a'}.$$

- If $x = 0$ and $y = 0$ then $(r, x, y) = (0, 0, 0)$. This yields a 2×2 identity matrix.
- (IGNORE for now) If $x \neq 0$ then we find $a', a, b', b, c', c, d', d$ from the equations above, and where (1) is satisfied.

Case 2. $r \neq 0$. Let p be a prime that divides r , $p \mid r$, and let e be the exponent of the largest power of p dividing a particular variable.

We define $e_{b'}$, e_d , and $e_{d'}$ as

$$e_d = \begin{cases} 0 & e_{1+y} = 0 \\ \min(e_r, e_x) & \text{otherwise} \end{cases} \quad \text{and} \quad e_{b'}, e_{d'} = \begin{cases} 0 & e_y = 0 \\ \min(e_r, e_x) & \text{otherwise} \end{cases} \quad (3)$$

To find d' we have that

$$d' = \prod_{p \mid r} p^{e_{d'}}. \quad (4)$$

Then the following systems of congruences can be solved

$$dy \equiv -d'x \pmod{p^{e_r}} \quad dx \equiv d'(1 + y) \pmod{p^{e_r}}, \quad (5)$$

and

$$b'(dy + d'x) \equiv -ry \pmod{p^{e_r + e_{d'}}} \quad b'(dx - d'(1 + y)) \equiv -rx \pmod{p^{e_r + e_{d'}}}. \quad (6)$$

We can then find the following variables

$$\begin{aligned} b &= \frac{r + b'd}{d'} & a &= \frac{bx - b'(1 + y)}{r} \\ a' &= \frac{by + b'x}{r} & c &= \frac{dx - d'(1 + y)}{r} \\ c' &= \frac{d'x + dy}{r}. \end{aligned}$$

- **Example 1:** (Not sure if this example is entirely correct - will go back and check later and then work into program) Let $(r, x, y) = (3, 2, 1)$ with $p = 3$. Then from (3), $e_d = 0$, $e_{b'} = 0$, $e_{d'} = 0$. We also have that $e_r = 1$, since the largest power $p \mid r$ is 1. Then, by (4),

$$d' = \prod_1 p^{e_{d'}} = \prod_1 3^0 = \prod_1 1 = 1.$$

By (5),

$$\begin{aligned} d &\equiv -2 \pmod{3} \\ 2d &\equiv -2 \pmod{3}, \end{aligned}$$

which $d = 1$ satisfies. By (6),

$$\begin{aligned} 3b' &\equiv -3 \pmod{3} \\ 0 &\equiv -6 \pmod{3}. \end{aligned}$$

which yields no solution for b' (this is not a problem though). Solving for each variable

$$\begin{aligned} b &= 3 + b' & a &= \frac{2(3 + b') - 2b'}{3} = \frac{6}{3} = 2 \\ a' &= \frac{3 + b' + 2b'}{3} = 1 + b' & c &= 2 - 2 = 0 \\ c' &= \frac{2 + 1}{3} = 1. \end{aligned}$$

Substituting into the matrix from (2),

$$\begin{pmatrix} 2 + i + ib' & i \\ 3 + b' + ib' & 1 + i \end{pmatrix}.$$

We can exclude b' in the following way

$$\begin{pmatrix} 2 + i + ib' & i \\ 3 + b' + ib' & 1 + i \end{pmatrix} \cdot \begin{pmatrix} 1 & 0 \\ -b' & 1 \end{pmatrix} = \begin{pmatrix} 2 + i + ib' - ib' & i \\ 3 + b' + ib' - b' - ib' & 1 + i \end{pmatrix} = \begin{pmatrix} 2 + i & i \\ 3 & 1 + i \end{pmatrix}$$

- **Example 2:** Let $(r, x, y) = (2, 4, 2)$ with $p = 2$. Then from (3), $e_d = 0$, $e_{b'} = 1$, $e_{d'} = 1$. We also have that $e_r = 1$, since the largest power of $p \mid r$ is 1. Then, by (4),

$$d' = \prod_{2 \mid 2} p^{e_{d'}} = \prod_1 2^1 = \prod_1 2 = 2.$$

By (5),

$$\begin{aligned} 2d &\equiv -4 \pmod{2} \\ 4d &\equiv 6 \pmod{2}, \end{aligned}$$

which $d = 0$ satisfies. By (6),

$$\begin{aligned} 4b' &\equiv -4 \pmod{4} \\ -6b' &\equiv -8 \pmod{4}, \end{aligned}$$

which $b' = 0$ satisfies. Solving for each variable

$$\begin{aligned} b &= \frac{2 + 0}{2} = 1 & a &= \frac{4 - 0}{2} = 2 \\ a' &= \frac{2 + 0}{2} = 1 & c &= \frac{0 - 6}{2} = -3 \\ c' &= \frac{8 + 0}{2} = 4. \end{aligned}$$

Substituting into the matrix from (2),

$$\begin{pmatrix} 2 + i & -3 + 4i \\ 1 & 2i \end{pmatrix}.$$

- **Example 3:** Let $(r, x, y) = (3, 1, 1)$ with $p = 3$. Then from (3), $e_d = 0$, $e_{b'} = 0$, $e_{d'} = 0$. We also have that $e_r = 1$, since the largest power of $p \mid r$ is 1. Then, by (4),

$$d' = \prod_{3 \mid 3} p^{e_{d'}} = \prod_1 3^0 = \prod_1 1 = 1.$$

By (5),

$$\begin{aligned} d &\equiv -1 \pmod{3} \\ d &\equiv 2 \pmod{3}, \end{aligned}$$

which $d = 2$ satisfies. By (6),

$$\begin{aligned} 3b' &\equiv -3 \pmod{3} \\ 0 &\equiv -3 \pmod{3}, \end{aligned}$$

which $b' = 0$ satisfies. Solving for each variable

$$\begin{aligned} b &= \frac{3+0}{1} = 3 & a &= \frac{3-0}{3} = 1 \\ a' &= \frac{3+0}{3} = 1 & c &= \frac{2-2}{3} = 0 \\ c' &= \frac{1+2}{3} = 1. \end{aligned}$$

Substituting into the matrix from (2),

$$\begin{pmatrix} 1+i & i \\ 3 & 2+i \end{pmatrix}.$$

Algorithm

We present the following algorithm used in our program.

Function 1 : Check condition (1) and the $p \mid r$.

```
1: if  $r \mid x^2 + y + y^2$  is not True then
2:   Raise an exception.
3: if ( $p$  is prime) is True then
4:   if  $p \mid r$  is not True then
5:     Raise an exception.
6: else
7:   Raise an exception.
```

Function 2 : Find e_d .

Require: Function 1 to hold true.

```
1: if  $p \mid (1 + y) == 0$  then
2:    $e_d \leftarrow 0$ 
3: else
4:    $e_r \leftarrow r/p$ 
5:    $e_x \leftarrow x/p$ 
6:    $e_d \leftarrow \min(e_r, e_x)$ 
```

▷ Want number of times $p \mid r$ and $p \mid x$

Function 3 : Find $e_{d'}$ and $e_{b'}$.

Require: Function 1 to hold true.

```
1: if  $p \mid y == 0$  then
2:    $e_{b'} \leftarrow 0$ 
3:    $e_{d'} \leftarrow 0$ 
4: else
5:    $e_r \leftarrow r/p$ 
6:    $e_x \leftarrow x/p$ 
7:    $e_{b'}, e_{d'} \leftarrow \min(e_r, e_x)$ 
```

Function 4 : Find d' .

Require: Calculated variables from function 2 and function 3.

```
1: iterations  $\leftarrow r/p$ 
2:  $d' \leftarrow p^{e_{dp'}}$ 
3: while iterations  $> 1$  do
4:    $d' \leftarrow d' \times p^{e_{dp'}}$ 
5:   iterations  $\leftarrow$  iterations - 1
```

Function 5 : Find d by solving first system of congruences.

Require: A solution to the first congruence to be possible.

```
1: left1  $\leftarrow y$ 
2: right1  $\leftarrow -d_p \times x$ 
3: left2  $\leftarrow x$ 
4: right2  $\leftarrow d_p \times (1 + y)$ 
5:
6: mod  $\leftarrow p^{e_r}$ 
7:
8: array  $\leftarrow$  an empty array
9: for  $i \in [0, \text{mod}]$  do
10:   insert 'i' into array
11:
12: for  $j \in$  array do
13:   eqn1  $\leftarrow (j \times \text{left1} - \text{right1})$ 
14:   eqn2  $\leftarrow (j \times \text{left2} - \text{right2})$ 
15:   if mod  $\mid$  eqn1 is True and mod  $\mid$  eqn2 is True then
16:      $d \leftarrow j$ 
17:     break
```

Function 6 : Find d by solving first system of congruences.

Require: A solution to the second congruence to be possible.

```
1: left1  $\leftarrow d \times y + d' \times x$ 
2: right1  $\leftarrow -r \times y$ 
3: left2  $\leftarrow d \times x - d' \times (1 + y)$ 
4: right2  $\leftarrow -r \times x$ 
5:
6: mod  $\leftarrow p^{e_r + e_{d'}}$ 
7:
8: array  $\leftarrow$  an empty array
9: for  $i \in [0, \text{mod}]$  do
10:   insert 'i' into array
11:
12: for  $j \in$  array do
13:   eqn1  $\leftarrow (j \times \text{left1} - \text{right1})$ 
14:   eqn2  $\leftarrow (j \times \text{left2} - \text{right2})$ 
15:   if mod  $\mid$  eqn1 is True and mod  $\mid$  eqn2 is True then
16:      $b' \leftarrow j$ 
17:     break
```

Function 7 : Find points to create matrix.

Require: All prior functions to have run first.

```
1:  $b \leftarrow (r + b' \times d)/d'$ 
2:  $a \leftarrow (b \times x - b' \times (1 + y))/r$ 
3:  $a' \leftarrow (b \times y + b' \times x)/r$ 
4:  $c \leftarrow (d \times x - d' \times (1 + y))/r$ 
5:  $c' \leftarrow (d' \times x + d \times y)/r$ 
```

Function 8 : Create matrix.

Require: Function 7 to have run first.

1: $a_{11} \leftarrow \text{complex}(a, a')$

▷ $\text{complex}(n, n') = n + n'i$

2: $a_{12} \leftarrow \text{complex}(c, c')$

3: $a_{21} \leftarrow \text{complex}(b, b')$

4: $a_{22} \leftarrow \text{complex}(d, d')$

Function 9 : Check circle equivalence.

Require: Function 7 to have run first.

```
1: if  $\Delta == -1$  then
2:   check  $\leftarrow (b \times d' - b' \times d, b \times c' - a' \times d, a' \times d' - b' \times c')$ 
3:   if check  $\neq (r, x, y)$  then
4:     raise an Exception
5: else
6:   check  $\leftarrow (b' \times d - b \times d', a' \times d - b \times c', b \times c - a \times d)$ 
7:   if check  $\neq (r, x, y)$  then
8:     raise an Exception
```
